FlowWorx LLC Awarded ISO 9001 :2015 Certification

JT400 - Ultra-Low Power Platform with Integrated I/O - market ready

FOR IMMEDIATE RELEASE: JUNE 11, 2020

EAST GRANBY, CONNECTICUT - FlowWorx LLC, creator of the JT400, has been awarded ISO (International Organization for Standardization) 9001 :2015 certification. ISO certifications are given to organizations that consistently comply with international standard requirements for ensuring quality management systems.

The qualifications for the ISO 9001 :2015 include providing products and services that meet customer needs in a consistent manner and ensures compliance to applicable statutory and regulatory requirements. Primary factors that are taken into consideration for certifying an organization's quality management system includes management responsibility, resource management, product realization and measurement processes that exhibit effectiveness and continual improvements. An audit by a certified body is performed to evidence and assess the process before certification is granted.

"We are honored to be awarded our ISO 9001 :2015 certification after much hard work and determination by everyone on the FlowWorx team," said Paul Mayer, FlowWorx LLC President. "The certification is a testament to our internal high standards and commitment to our customers. ISO registration supports our pursuit of continuous improvements, product quality and customer satisfaction."

ABOUT FLOWWORX

FlowWorx LLC was established in 2012 and designs and manufactures devices for remote pipeline monitoring. FlowWorx was acquired by WellWorx Energy in November of 2018 to compliment several additional product lines that service the petroleum industry. Our Multivariable Pressure Transmitter – the JT400 – is the first ultralow power, high-performance transmitter on the market. It was designed by industry experts for today's upstream and midstream operators to deliver the most capabilities at the lowest power. As a completely autonomous device, it requires no support equipment, making it ideal for upstream and midstream operations while providing quick and cost-effective installations. Packed with features and benefits like no other MVT, the JT400 offers digital and analog I/O, external USB port and up to 12-year battery life (with solar) and up to 4 years with a lithium battery pack – all in an explosion-proof housing. Our product guarantees full support across North America through our partners BettsM Controls, AWC and Process Control Dynamics.

The JT400 has also received single-seal certification per ANSI and expects a CRN (Canadian Registration Number) in the summer of 2020. Coupled with the ISO 9001: 2015 certification, these three certifications will bring FlowWorx and the JT400 into the forefront of midstream sensor technology. A fully autonomous flow computer is currently in development as well.
